Child abuse in the context of intimate partner violence against women: the impact of women's depressive and posttraumatic stress symptoms on maternal behavior.

Boeckel MG¹, Blasco-Ros C, Grassi-Oliveira R, Martinez M.

Author information

Abstract
Intimate male partner violence against women has been recognized as an important public health problem, with a high impact on women's mental health, including depressive and posttraumatic stress disorder (PTSD) symptoms. However, fathers who have been involved in intimate partner violence (IPV) have an increased probability of being violent toward their children. The aim of this study was to assess the relation between the mental health status of abused women, their partner's violence toward the children, and their maternal behavior.
