- Quality of working life
- Well-being
- Fuzzy-set qualitative comparative analysis

ABSTRACT

Nowadays, owing to the changing nature of the work environment, with its ever-increasing demands, the quality of working life and its relationship with the individual’s wellbeing are recognized worldwide as vital for the workforce. This study analyzes the role of employees’ perception of five quality of working life attributes (specifically workplace conditions, working life autonomy, corporate citizenship, remuneration, and workplace diversity and inclusion) in ensuring the individual’s wellbeing focusing in particular on workers’ perception of work-life balance, working life opportunities, and health and wellness. The results of the fuzzy-set qualitative comparative analysis reveal the same various configurations for the three outcomes that suggest a new perspective towards understanding the factors in employees’ working life that enhance their wellbeing, and so improve workforce maintenance. The results have managerial implications related to work-life management for workforce maintenance.

1. Introduction

Improving the quality of working life has long been a goal of industrial relations and organizational research (e.g., Walton, 1974; Mickel & Dallimore, 2009). Recent changes in the nature of work and personal environments have made achievement of this goal a higher priority (Grote & Guest, 2017). From the perspective of the work environment, digitalization and flexible work arrangements, among other changes, have resulted in positive outcomes, but also in certain negative consequences that need consideration, as they can damage the individual’s quality of personal and family life (Böhne & Cifuentes, 2018). Blurred work-personal life boundaries, and chronic health burnout (Kossek, 2016), or precarious employment often associated with a risk of exploitation, low earnings, or threats to work-life balance (Benavides et al., 2006; Sonnentag & Binnewies, 2013) are some such consequences. From the perspective of the personal environment, new roles for men and women have appeared, family composition is more complex and diverse, and individuals’ sexual, religious, and cultural diversity is more evident (Kossek, 2016; Oláh, Kotowska, & Richter, 2018). Additionally, individuals now have more interest in devoting time to private issues, and in the quality of their lives outside of the organization for which they work (Guest, 2002). All these changes have significant implications for families, businesses, and society as a whole. In fact, from the perspective of the organization, the neglect of some of these characteristics can lead to workforce vulnerability and, consequently, high health care costs; high staff turnover at all organizational levels; and even, on occasion, organization-wide workforce crises (Lucas, Manikas, Mattingly, & Crider, 2017). Improving the quality of working life is thus a high priority for today’s organizations.

There are many studies that point to a positive relationship between quality of working life, improved employee’s job satisfaction and organizational commitment (Daud, 2010; Mosadeghrad, 2013), and lower employee burnout, absenteeism, and turnover (Korunka, Hoonakker, & Carayon, 2008). Such positive outcomes result in a more stable workforce, and improve business efficiency, productivity, and profitability, with positive consequences for business performance (May, Lau, & Johnson, 1999). Accordingly, research suggests focusing on giving “primacy to improving the wellbeing of workers, rather than enhancing organizational performance”, which was the original aim of the quality of working life movement promoted in the 60 s and 70 s (Grote & Guest, 2017, p. 151).

To better understand workers’ wellbeing, it is imperative to highlight the fact that the border between an individual’s work and non-work life is not a sharp one, and in many cases, they overlap (Kossek, 2016).
Work, family, and personal lives influence each other (Olah et al., 2018). People will perform better as individuals and workers if, as part of an organization, their economic, social, and psychological needs are satisfied (Indumathy, 2012).

Wellbeing is a subjective perception (Cummins, 2005) that depends on several domains of life, such as personal relationships, achievements in life, future security, and personal health (Lau, Cummins, & McPherson, 2005). The present research focuses on the aspects of the individual’s wellbeing that are closely related to the individual’s working life. We seek to understand what influences employees’ perception of work-life balance, of their career opportunities, as well as of their health and wellness. Considering the criteria that influence quality of working life posited by Grote and Guest (2017), we investigate the role of the employee’s perception of five different working life attributes: workplace conditions, working life autonomy, corporate citizenship, remuneration, and workplace diversity and inclusion. The aims of this research are two-fold: to explore those qualities of working life criteria that can be managed, so as to improve the quality of working life, and to investigate the contribution of those factors to the three domains of the individual’s wellbeing under consideration: perception of work-life balance, career opportunity, and health and wellness. The findings of this research should provide companies with valuable insights, enabling them to adequately manage their workforce in ways that favor individual wellbeing and retain employees.

With these aims in mind, fuzzy-set qualitative comparative analysis (fsQCA) is performed on data collected from international firms that usually attribute high importance to the quality of working life and wellbeing of their employees. This responds to the call of Grote and Guest (2017) for more research related to working life quality management with sufficient academic rigor and practical relevance. The methodology adopted in this study follows a complementary approach to the ones performed in other papers that sheds light on the determinants of the quality of working life, and their relationship to the dimensions of the individual’s wellbeing.

The remainder of this paper is organized as follows. In section 2, the relevant literature in the management and organizational field is reviewed. The review covers the three analyzed aspects of an individual’s wellbeing and the factors that a company can influence to improve the quality of their working life. In section 3, the methodological details are presented, followed by the analytical results in section 4. The paper ends with an in-depth discussion and implications of our findings in section 5.

2. Literature review

Organizational interventions in working life have been considered in a number of contexts such as vocational and industrial behavior (Delanoieje, Verbruggen, & Gernleys, 2019), work-life leadership in human capital development (Hammond, Clapp-Smith, & Palanski, 2017), and work-life aspiration and autonomy in organizational culture changes (Driedonks, Gevers, & van Weele, 2010; Kossek, Hammer, Kelly, & Moen, 2014). Most work-life research considers employees in many kinds of physical and social circumstances, and points to management interventions that can facilitate achieving a balance of the personal and the professional spheres and, as a result, a stable workforce.

This section reviews the related concepts of work-life policies that can improve the quality of working life under the rubrics of workforce maintenance; it covers workplace conditions, working life autonomy, corporate citizenship, remuneration, and workplace diversity and inclusion. Work-life management intervention aims for outcomes that are congruent with the employees’ interests in relation to their life within and outside work. Employees’ perceived satisfaction with any of their workplace conditions can affect their personal wellbeing. Specifically, the perceptions contributing to the individual’s wellbeing that this study considers are perceptions of work-life balance, of working life opportunities, and of health and wellness. These variables and outcomes are discussed in detail below.

2.1. Areas of the individual’s wellbeing related to the quality of working life

2.1.1. Perception of work-life balance

Hill, Hawkins, Ferris, and Weitzman (2001, p. 49) define work-life balance “as the degree to which an individual is able to simultaneously balance the temporal, emotional, and behavioral demands of both paid work and family responsibilities”. It is not a new topic, as previous research has investigated the rationales and theories of work-life balance for devising policies and management solutions to mitigate the conflict between work and life spaces (Delanoieje et al., 2019).

Flexibility in timing and location of work, derived from the sophisticated communication platforms present in many companies can, at first sight, appear to favor a work-life balance (Hill et al., 2001). However, research finds that employees perceive that one effect of such flexibility is that aspects of their work and non-work lives become increasingly blurred. The result is an ambiguity between work and personal life that disrupts employees’ efficiency at work and, simultaneously, their satisfaction with life (Dumas & Sanchez-Burks, 2015; Carlson, Thompson, & Kacmar, 2019). Nevertheless, another perspective argues that work and life interests are inseparable, and that institutions should offer a high level of work flexibility over the course of an individual’s working career, with only a limited restriction in an individual’s personal life (Tomlinson, Baird, Berg, & Cooper, 2018).

Clearly, these two perspectives underlie different management intervention approaches that help employees control interworking work and life role domains. Regardless of the perspective adopted, employees’ ability to control their schedule is crucial to avoiding an over-irruption across work-life space that can lead to a tense, antithetical worker-organization relationship (Haar, Russo, Suine, & Ollier-Malaterre, 2014; Kossek, Ruderman, Braddy, & Hannum, 2012). Therefore, work-life balance requires that management facilitate appropriate career commitment, without compromising employees’ personal interests and health.

2.1.2. Perception of working life opportunities

Working life opportunities can be defined as work-related goals and career aspirations. Working life opportunities address the mutuality of career prospects and personal interests. Applied psychology has identified certain factors that carry significant mediating, or moderating, effects on working life opportunities. These factors cover career and personal aspects; for example, judgement of work-life possibilities (Kim, Foud, & Lee, 2018), costs and benefits at work (Creed, Hood, & Hu, 2017; Shepley et al., 2017), self-efficacy (Alicic & Wiese, 2020), and self-regulation (Napolitano, Hoff, Ming, Tu, & Rounds, 2020). Likewise, research on organizational psychology finds that two complementary factors, namely personality (Ilies & Judge, 2003) and work-life situation (Unanue, Vignoles, Dittmar, & Vansteenkiste, 2016), determine career goals and aspiration. Working life opportunities are perceived as satisfactory when these factors are congruent (Unanue et al., 2016) and, in general, when career prospects and personal interests are achieved at the same time.

2.1.3. Perception of health and wellness

A routine work schedule would seem impossible in today’s global business environment, in which business activities are conducted round the clock. Employees are expected to respond rapidly, or even instantly, to work-related demands from their ‘virtual’ colleagues (Makarius & Larsson, 2017). Physical and emotional stresses encountered at work can drain employees’ energy and sap their enjoyment of life (Creed et al., 2017). Baicker, Cutler, and Song (2010) point out that irregular work practices pose a number of deleterious health and wellness impacts such as loss of enthusiasm for work, perceived devaluation of personal life, and escalating costs of healthcare-related expenses for organizations and
society. Current applied research into work-life health and wellness has investigated management solutions (e.g., Baicker et al., 2010; Burton, 2010; Hoert, Herd, & M., & Hambrick, M., 2018). Burton (2010) surveyed key wellness domains, including psychological and physical work environments, corporate-community involvement, and health resources. His key finding is that employees’ perception of their health and wellness is optimized when companies take both the work environment, and the health and wellbeing of their employees, into consideration.

2.2. Quality of working life factors

2.2.1. Workplace conditions

Workplace conditions encompass a broad range of circumstances that help workers perform work-related tasks. Prior research shows that appropriate workplaces and facilities can help employees boost their performance and productivity. Further, satisfaction with workplace conditions can trigger a positive psychological effect on employees’ perceived privacy (Kim & de Dear, 2019), dignity (Lucas, Kang, & Li, 2013), ability to deal with excessive stimulation (Maher & von Hippel, 2005), and socializing behavior in the workplace (Iachini et al., 2016). Accordingly, satisfaction with workplace conditions can promote psychological wellbeing, interpersonal relationships, and a positive impact on work efficiency.

2.2.2. Working life autonomy

Working life autonomy is a characteristic of workplace flexibility, involving flexibility in work arrangements and in work processes. Research on the topic supports a positive relationship between workplace flexibility, quality of personal life (Subramaniam, Tan, Maniam, & Ali, 2013), and work-life balance (Hill et al., 2001), demonstrating that businesses, as well as the personal and family life of employees, benefit from such flexibility.

Autonomy necessarily accompanies control, but it does not mean that autonomy in the workplace gives workers extraordinary authority or superordinate control (Kosek et al., 2014). Rather, it means that workers have discretion with regard to work schedules and styles, which enables them to respond to unexpected needs in the course of their life (Driedonks et al., 2010). In fact, total working life autonomy could well lead to employees’ pressuring themselves to work anytime and/or anywhere outside the workplace (Hill et al., 2001; Eurofound, 2015). Employees, given total work-life autonomy, and in the absence of employer engagement, might not be able to limit their working hours. From an industrial psychology perspective, working life autonomy can be regarded as effective only when employees and employers reach a consensus on working life norms, and on being able to adjust workplace flexibility policies as required (Driedonks et al., 2010; Prem, Kubicek, Diestel, & Korunka, 2016).

2.2.3. Corporate citizenship

Corporate citizenship, or corporate social responsibility, is a management value that concerns corporate behavior insofar as it is grounded in the belief that remuneration helps attract and retain those whose work attributes and performance are appropriate for employers. Accordingly, it is crucial that employees perceive a congruence between their remuneration, and what they desire to acquire in their work and life domains; there is much research highlighting the relationship between satisfaction with remuneration and both personal economic wellbeing and physical and psychological wellbeing (Kessler, 2015).舀

2.2.4. Remuneration

The relevance of remuneration as a working life management criterion resides in its support for the employee’s lifestyle, sense of security, and fulfillment of lifetime aspirations (Peterson, Ekici, & Hunt, 2010). Remuneration is also linked to employees’ views of how their efforts benefit their employers, and how important their contribution is when compared with that of others, which is relevant to the fairness of remuneration policies (Gerhart & Rynes, 2003). The mixed concerns of adequacy and fairness of remuneration usually critically challenge organizations. To manage employees with different expectations of living standards (Hofmans, De Grieter, & Pepermans, 2013). Research also suggests that remuneration can influence performance through two different mechanisms, i.e., the incentive-outcome effect, and the sorting effect (Gerhart, 2004; Gerhart & Fang, 2014). The incentive-outcome effect considers the motivational impact of remuneration upon individual employee performance. The rationale behind doing so is that remuneration is a factor in motivating employees. In contrast, the sorting effect concerns the influence of remuneration on the type of employees that are attracted to, or retained by, organizations. It is grounded in the belief that remuneration helps attract and retain those whose work attributes and performance are appropriate for employers. Accordingly, it is crucial that employees should perceive a congruence between their remuneration, and what they desire to acquire in their work and life domains; there is much research highlighting the relationship between satisfaction with remuneration and both personal economic wellbeing and physical and psychological wellbeing (Kessler, 2013).

2.2.5. Workplace diversity and inclusion

In the organizational literature, diversity describes the composition of groups or workforces. Workforce diversity refers to characteristics such as gender, race, ethnicity, age, class, sexual orientation and cultural attributes of employees (Kochan et al., 2003; Jayne & Dipboye, 2004; Lau & Murrighan, 2005). The concept of inclusion would imply no discrimination against workers owing to any of these characteristics, so that they feel satisfactorily integrated into their work team, and the organization in general. Similar to other scholars in the field, Jayne and Dipboye (2004, p. 410) advocate that “inclusion as a diversity strategy attempts to embrace and leverage all employee differences to benefit the organization. As a result, managing all workers well has become the focus of many corporate diversity initiatives.”

Nowadays there are many organizations, particularly those operating internationally, that manage a large number of interdependent functional work tasks, employing diverse professionals and operational employees as networked, complementary resources (Driedonks et al., 2010; Ng & Wyrick, 2011; Van Knippenberg, van Ginkel, & Homan, 2013). There are many studies examining different aspects of workplace diversity—cultural, ethnic, age, religion—and their influence on well-being (e.g., Enchautegui-de-Jesús, Hughes, Johnston, & Oh, 2006; Peterson, 2006). In social theories, the presence of group dominance impedes organizations or institutions from tapping into the full potential arising from their workers’ different attributes (Jayne & Dipboye, 2004; Gutierrez & Saint Clair, 2018). Coordinated or collaborative workforce diversity encourages organizations to move towards new business orientations and innovations (To, 2016). Diversity and the acceptance of differences in the workplace can catalyze organizational culture changes that win the trust of all the stakeholders in the entire business and social
ecosphere (Mamman, Kamoche, & Bakuwa, 2012). As such, workforce diversity and inclusion provide a means to nurture a work culture infused with cooperate goodwill, and employees who value their workplace identity (Mamman et al., 2012).

After reviewing the literature on the topics of interest, we could posit one main effect of each of the quality of working life factors on each of the individual’s wellbeing domains. At first sight, it would appear that all the quality of working life factors should be positively perceived for employee to perceive wellbeing. However, this could be a consequence of the methodology commonly used, which is mainly based on dependency or causal relationships. FsQCA considers equifinality and causal complexity tenets and, accordingly, this research attempts to answer the following research question:

RQ1: Which of these attributes of the quality of working life, i.e. the employee’s perception of a) workplace conditions, b) working life autonomy, c) corporate citizenship, d) remuneration, and e) workplace diversity and inclusion, are necessary to perceive wellbeing in each of the three areas analyzed, i.e. (i) perception of work-life balance, (ii) career opportunities, and (iii) health and wellness?

RQ2: How should the attributes of quality of working life under consideration be combined to ensure wellbeing in each of the three areas analyzed?

3. Methodology

3.1. Context of the analysis

This research conducted an empirical survey of international companies in the estuary of the Pearl River Delta (PRD) region of Southern China. The PRD is the context of this study for two reasons. First, work-life vulnerability is an imperative concern for companies in the PRD. The economic drivers of this region are mainly based on international trade and industrial services, with an export value of approximately US$664 billion in 2018 (National Bureau of Statistics of China, 2019), making up 26% of China’s total exports by value. The massive industrial and service sectors create tremendous social and environmental challenges to companies in areas such as social security and identity as well as health and pollution, leading to management concerns about work-life vulnerabilities (Locke & Romis, 2007; Valentine et al., 2011). Second, the efficacy of workforce maintenance management is a key performance indicator of companies in the PRD, where, workload, work dignity, and psychological stress have been the subject of much criticism (Lucas et al., 2013). For management, their employees’ working life is not merely a managerial matter, involving such concerns as where people in the workplace are located, or how much time employees can rest, but a strategic issue that involves mitigating foreseeable workforce vulnerabilities. As such, companies should assess their performance by looking at the wellness of their employees, and the efficacy of workforce maintenance management. For these reasons, the PRD region is a suitable context in which issues of work-life management and individual wellbeing are examined.

3.2. Data collection

To answer the proposed research questions, we conducted quantitative research, gathering information through an online structured questionnaire. The questionnaire was divided into two main parts. The first part was concerned with the socio-demographic variables of the interviewees, while the second part focused on measuring the main constructs of analysis. The scales to measure those constructs were based on considerations posited in existing literature on the topic and on scales previously used, but adapted to the context of the present research. Workplace conditions were measured considering the suggestions made in the research of Maher and von Hippel (2005), Kim and Dear (2013), Kossek (2016), and Moskalik, Burmeister, Landkammer, Renner, and Cress (2017); working life autonomy, using suggestions from Grzywacz and Marks (2000), Kossek et al. (2014), and Prem et al. (2016); corporate citizenship, from Edwards and Rothbard (2000), Podsakoff et al. (2000), Hanson et al. (2006), and Hammond et al. (2017); remuneration, from Gerhart and Rynes (2003), Hofmans et al. (2013), and Gerhart and Fang (2014); workplace diversity and inclusion, from Jayne and Dipboye (2004), Ng and Wyrick (2011), Mamman et al. (2012), and Gutierrez and Saint Clair (2018); and work-life balance, from Hill et al. (2001) and Greenhaus, Collins, and Shaw (2003); working life opportunities, from Ilies and Judge (2003) and Creed et al. (2017); and health and wellness, from Balckier et al. (2010), Indumathy (2012) and Hoert et al. (2018). Respondents judged all these aspects of working conditions on five-point multi-item Likert scales, ranging from 1: “completely disagree”; to 5: “completely agree”.

This questionnaire was targeted at executives working in international companies, including those in international multi-merchandise stores, associates of buying agents, coordinators in multinational manufacturing corporations, and consultants working for international audit firms. To participate in the survey, respondents had to meet two criteria. One was that they should be knowledgeable of the specific working life characteristics of their organization, by either experience or qualification. Meeting this criterion should show that respondents can appropriately comment on work-life management interventions in the areas of interest. The other criterion was that they should be able to state their career aspirations and personal life orientation. This criterion ensured that the responses would substantially and sufficiently reflect the possible relationship between work-life experience and perceived wellbeing.

Convenience sampling was used. Upon completion of data collection, 176 questionnaires were gathered. However, eleven questionnaires were incomplete and discarded. A total of 165 responses were therefore subjected to further analysis.

3.3. Psychometric properties of the scales

Before analyzing the data to answer the research questions, we assessed the psychometric properties of the scales (Table 1). The confirmatory factor analysis, performed with Partial Least Squares, showed that it was not necessary to eliminate any item from any of the scales, as the standardized loadings on their respective factors were significant and greater than 0.6 (Bagozzi & Yi, 1988). As Table 1 displays, all scales met the criteria for reliability, convergent, and discriminant validity. Cronbach’s alphas showed values higher than 0.7 (Nunnally & Bernstein, 1994); composite reliability showed values above the suggested minimum threshold of 0.8 (Bagozzi & Yi, 1988); the average variance extracted values were greater than the accepted threshold of 0.5, and the covariances between constructs were lower than the corresponding average variance extracted, ensuring discriminant validity (Fornell & Larcker, 1981).

3.4. Analysis method: fsQCA

This study employs the fsQCA method to analyze the collected data. The distinctive feature of the fsQCA method is that it identifies and analyzes combinations of causal conditions that lead to a particular outcome. The identification and analysis reveal the interconnected structures of the causes in various configurations, and the complex nature of the interdependencies between causes, in each configuration (Ragin, 2000, 2008). It is not based on symmetric relationships among variables, and it is expected that the causal structure will be equifinal and complex (Woodside, 2016). Considering that the main goal of this study is to identify the configurative structures of the quality of working life factors, and to analyze the configurations’ impacts on the three employees’ wellbeing domains, fsQCA is an appropriate method. It offers a detailed understanding of the complex causal relationships between the quality of working life factors and wellbeing, as well as rich insights into the effect of causal recipes of wellbeing.
FsQCA treats all of the measurements from each respondent as an individual case and calibrates the raw item measurements (measure on a five-point Likert interval scale) into fuzzy membership scores within a 0 to 1 range. This means that each multi-item scale has to be transformed into one single-item scale in order to be calibrated. With that purpose, we calculated the average of each multi-item scale. To transform each variable (or one single-item scale) into calibrated sets, we set three thresholds: full membership (1), full non-membership (0), and cross-over point (i.e., the point of maximum ambiguity, ~0.5) (Ragin, 2008). The values considered for calibration were 5 for full membership, 1 for full non-membership and 3 for the cross-over point.

### 4. Results

In order to answer RQ1, following Ragin’s (2000, 2008) guideline, we tested the necessary conditions for each outcome to occur; i.e., whether each causal condition was needed for perceiving work-life balance, working life opportunities, and health and wellness. The thresholds used to check the necessity were 0.90 for consistency, and 0.75 for coverage (Ragin, 2006). Table 2 displays the results. We find that not all the five causal conditions play the same role in bringing about the three outcomes. Regarding the perception of work-life balance, only perception of working life autonomy, and satisfaction with workplace diversity and inclusion, are necessary conditions for it to occur. Nevertheless, when considering perception of working life opportunities, four out of the five causal conditions are necessary; results show that satisfaction with remuneration is the only causal condition that is not necessary for an employee to perceive working life opportunities. Finally, for the individual to perceive health and wellness, no causal condition is necessary, as none of the variables considered meets the required thresholds.

We checked the sufficient conditions in order to answer RQ2. FsQCA models the solutions (i.e., the configurations of the five quality of working life factors) that sufficiently precondition the three wellbeing outcomes, i.e., perception of work-life balance, of working life opportunities, and of health and wellness. The five causal conditions—working place condition, working life autonomy, corporate citizenship, remuneration, and workplace diversity and inclusion—must be the superset of these three outcomes.

When performing this analysis, it is necessary to consider that, in the fsQCA, not every theoretical configuration occurs in the observations, or at appreciable occurrence rates. Therefore, proportional reduction in inconsistency (PRI) was conducted to test possible hidden asymmetry, in which both the presence and absence of the considered causal conditions could result in the solutions with valid, sufficient consistency. Such contradictory asymmetry would violate the logicality and causality of the interpretation. Those configurations with PRI consistency values below the theoretical threshold of 0.5 are considered to be violating the logical set-theoretic relations; hence, they must be removed from the truth table before any further solution analysis. In fsQCA, membership scores of outcomes should be consistently greater than the scores of configured conditions of antecedents. Ragin (2008) formalized the value of consistency necessary to indicate the extent to which a subset relationship can be verified reliably or proximately. This research sets the minimum threshold of raw consistency at 0.8 to test the set-theoretic relationships. Moreover, the fsQCA conservatively sets the minimum frequency cut-off at two, when specifying the observed cases for analysis (Ragin, 1994, 2008). All these considerations were applied to the analysis of the sufficient conditions. Table 3 summarizes the results of the immediate solutions for each outcome.

For 86% of those interviewed who perceived work-life balance, that perception of work-life balance can be explained by one of the four causal configurations (solutions) depicted in Table 3; the overall consistency, a comparable value to the R-squared (Woodside, 2013), is 0.91 which indicates the extent to which perceiving work-life balance can be related to a set of configurations. Accordingly, employees who perceive work-life balance: (1) are satisfied with their workplace conditions, perceive high working life autonomy, perceive corporate citizenship, and also high workplace diversity and inclusion; (2) are satisfied with their workplace conditions, perceive high working life autonomy, perceive corporate citizenship, and are satisfied with their remuneration; (3) are satisfied with their remuneration, but do not perceive working life autonomy, nor corporate citizenship, nor workplace diversity and inclusion; (4) perceive corporate citizenship, but are not...
The individual working life opportunities, has to be present (not absent); i.e., the in
casual configuration in the perception of work-life balance and of
quality of working life is recognized as vital for the wellbeing of the
cits of these factors in favoring specific domains of the individual
satisfied with workplace conditions, nor do they perceive working life
satisfaction with workplace conditions
Perception of workplace diversity and inclusion
Perception of corporate citizenship
Satisfaction with remuneration
Perception of working life autonomy

Frequency cut off 2 2
Consistency cut off 0.94 0.97 0.93
Note: ● indicates the presence of a condition; ◯ indicates its absence; blank space indicates “don’t care”.

Concerning the results for the perception of working life opportunities, according to Table 3, we can see that the four solutions, consid-
ered altogether, can explain 91% of the cases reporting employees’ high perception of working life opportunities. It is surprising that the four
causal configurations resulting in sufficient conditions for this outcome to occur are the same as those for the perception of work-life balance;
also, the two first-mentioned causal configurations are, again, the ones that encompass most of the employees with a high perception of
working life opportunities.
Finally, only one causal configuration is found to be a sufficient condition for employees perceiving health and wellness; this causal
configuration accounts for 91% of the employees reporting high health and wellness perception. An employee reporting perception of health
and wellness is an employee who is satisfied with his or her workplace conditions, perceives high working life autonomy, perceives corporate
citizenship, and a high degree of workplace diversity and inclusion. This solution is also a sufficient causal configuration for the other two outcomes to occur. Remarkably, satisfaction with remuneration is not a causal condition leading to perception of health and wellness.

From these results, we demonstrate that working life autonomy and corporate citizenship are key issues in influencing perception of work-
life balance, of working life opportunities and of health and wellness, as these two causal conditions, present or absent, are in all the causal
configurations reported for the analyzed outcomes. We also consider it relevant to mention that remuneration, when it does play a role within a
causal configuration in the perception of work-life balance and of working life opportunities, has to be present (not absent); i.e., the indi-
vidual has to be satisfied with it in order to participate in reaching the outcomes.

5. Discussion and conclusions

Driven by the ever-increasing demands of the work environment, the quality of working life is recognized as vital for the wellbeing of the
workforce in contemporary organizational contexts (Grote & Guest, 2017). The individual’s working life and personal sphere are inextric-
ably linked, and there are many aspects of the working life context that can have consequences at a personal and/or family level. These con-
nections will have a significant impact on individuals’ wellbeing and, consequently, their overall job satisfaction and whether they intend to
stay or leave their place of work.

This research considers some factors that make up the quality of working life, and identifies the role of various set-theoretic configura-
tions of these factors in favoring specific domains of the individual’s wellbeing, linked with effective workforce maintenance. The analyzed
factors of quality of the working life comprise satisfaction with workplace conditions, perception of working life autonomy, perception of
corporate citizenship, satisfaction with remuneration, and perception of workplace diversity and inclusion; the wellbeing outcomes comprise
perception of work-life balance, working life opportunities, and health and wellness.

The paper contributes to a clearer understanding of which factors related to the quality of working life are present when the individual feels wellbeing, both within and outside the workplace. Such wellbeing improves the commitment of the workforce to their workplace. Furthermore, this study reveals that the key conditions of work-life wellness are attainable in today’s globalized businesses. It also recog-
nizes the need for, and the importance of, fsQCA in understanding contextual relationships in business management.

The answers to the two research questions lead to two main conclusions. The first is that the quality of working life factors considered here are not equally necessary for the individual to perceive wellbeing in the three analyzed domains. In fact, for the health and wellness domain, no causal condition is necessary; however, the working life opportu-
nities domain appears at the other extreme, as four out of the five factors are necessary (only remuneration plays no role).

The second conclusion is that the same combination of quality of working life factors results in sufficient conditions for the three outcomes. Accordingly, managers can practice the same interventions with respect to these factors to achieve different results for wellbeing. In fact, of the different quality of working life factors, two play a key role: the perception of corporate citizenship and remuneration.

The perception of corporate citizenship appears in all the solutions, being present in three solutions and absent in one. The presence of
corporate citizenship leads to the perception of work-life balance and working life opportunities even in the absence of other causal condi-
tions. Moreover, it is a necessary condition for the perception of working life opportunities. These results show that corporate citizenship exerts a
supporting effect on the three domains of the individual’s wellbeing. Management should therefore not ignore the fact that corporate citi-
zenship can benefit employees in all these ways. Employees are more likely to perceive work-life balance, working life opportunities, and
health and wellbeing when their organization cultivates its reputation as a good corporate citizen. As well as boosting employees’ wellbeing, it
makes a positive contribution to the society, and its values permeate the entire organization. Most of the research on corporate citizenship has
looked into its influence on external stakeholders (Maignan & Ferrell, 2001b); yet, it can be seen that it significantly impacts the internal
stakeholders; that is, the employees. Workers not only can observe how their company’s policies and practices affect their local community or
society in general, but also can directly benefit from their company’s corporate citizenship through better wages, or better working life

Sufficient conditions for the outcomes to occur.
practices regarding health, safety or other working conditions (Rego et al., 2010); consequently, that perception of corporate citizenship influences their affective commitment to their organization (Peterson, 2004; Rego et al., 2010). Literature suggests a positive link between perceived corporate citizenship and the expectations of career success of those seeking jobs (Lin et al., 2012). In addition, research highlights that the employee’s perception of receiving social support within the company is even more important to better working life outcomes than the formal presence of family-friendly policies (Allen, 2001; Thompson & Prottas, 2006). These results could explain why, even in the absence of satisfaction with workplace conditions and of perception of working life autonomy and workplace diversity and inclusion, employees perceive work-life balance and working life opportunities when they perceive corporate citizenship.

Focusing on remuneration, the present research brings together two research perspectives on job satisfaction and turnover intention, with ambiguous theoretical and empirical results. As Nyberg (2010) highlights, some studies analyzing employees’ decisions as to whether to remain in or leave an organization focus on the individual’s attitude, and do not consider remuneration. This stream of research provides support to the solution in which four out of the five causal conditions analyzed have to be present for employees to perceive work-life balance and working life opportunities, namely: satisfaction with workplace, perception of autonomy, corporate citizenship, and workplace diversity and inclusion. However, Nyberg (2010) suggests a negative relationship between employee performance and voluntary turnover, in which job satisfaction plays no role. Our findings reveal that, even when individuals do not perceive quality in their working life (more precisely, they do not perceive working life autonomy, corporate citizenship, or workplace diversity and inclusion), when they are satisfied with their remuneration they have a positive perception of work-life balance as well as of working life opportunities. Thus, for some employees, high satisfaction with remuneration can compensate for their low satisfaction with regard to some aspects of quality of working life, resulting in a perception of wellbeing in terms of work-life balance and working life opportunities. These results give support to Wilensky (1960) proposition that individual can seek reward in one domain to compensate for dissatisfaction in other domains; and also for the spillover hypothesis, that what happens in one individual’s domain has consequences in his or her other domains.

On the other hand, perception of health and wellness is not found to have the relationship with remuneration that one would reasonably expect; yet, it is linked to workplace and job characteristics (conditions and autonomy), diversity and inclusion, and how workers perceive their organization’s corporate citizenship.

For employees to perceive wellbeing, satisfactory workplace conditions and working life autonomy have to be present, except when they are satisfied with remuneration or perceive corporate citizenship. To put it another way, in the latter two situations, satisfactory workplace conditions and working life autonomy can be absent for employees to perceive wellbeing.

Surprisingly, the individual can perceive wellbeing even in the absence of perception of workplace diversity and inclusion. Perhaps, this picture reflects the “one-size–fits-all” policies of diversity and inclusion suggested by Hutchinson (2018), i.e. when managers believe that a single policy fits everybody. Quite often, supervisors have an unconscious bias when giving support to employees’ requests that contain references of this type of diversity. They are motivated by their requests that they do not understand, or find meaningless (Hutchinson, 2018).

To summarize, we conclude that the quality of an individual’s working life is influenced by his or her satisfaction with workplace conditions, perception of autonomy, corporate citizenship and workplace diversity, as well as satisfaction with remuneration: all are important elements for that can contribute to the individual’s wellbeing in terms of work-life balance, working life opportunities, and health and wellness. Nevertheless, managers do not have to consider all of them together, nor the presence of any single factor. Instead, it is important that they consider how some or all of these factors combine.

The results of this study suggest some ways in which managers can intervene that improve the quality of working life of their employees. Since not all employees have the same vision of wellbeing, such interventions could be tailored according to the specific situation and characteristic of the employee. This would involve an additional effort by managers to find out what exactly influences the wellbeing of each employee. Whatever the case, management would be well advised to accommodate the mutuality between economic and social considerations in order to reduce employee turnover.

Management may decide to rely solely on monetary compensation to foster their employees’ wellbeing. However, this might be effective only for those employees who perceive money as the most important reward for their work. These employees would consider a higher monetary reward as compensation for those other aspects of the quality of their working life with which they are not satisfied.

Regarding social considerations, management wanting to maintain a loyal workforce would do well to consider their employees’ satisfaction with workplace conditions, with their working life autonomy, the company’s corporate citizenship, and workplace diversity and inclusion. Employees more readily perceive workplace conditions and work-life autonomy, than corporate citizenship and workplace diversity and inclusion. To promote corporate citizenship, companies should communicate properly and through the appropriate media about their actions linked to corporate citizenship. This would enable employees to perceive how committed their companies are to them and to wider society. Managers should show that they see workplace diversity and inclusion as imperative for their companies and intervene appropriately. They could make an effort to analyze all the diversity categories existing in the organization, or establish a diversified advisory team in order to enhance supervisors’ awareness of diversity in their organization.

As with other studies, this research has certain limitations. It focuses on the limited geographical area in which data were collected. Future research should be conducted in other geographical areas to establish whether the results of this study can be generalized. Although literature supports the relationship between the outcomes analyzed in this paper and employees’ intentions as to whether or not to remain with their company, this paper does not measure such intentions; future research should consider doing so, to enrich the understanding of workforce maintenance.

Moreover, future papers should focus on the influence of working life attributes in other wellbeing domains, mainly that of employees’ personal life outside the work environment. One interesting factor that could be explored in future analysis is the employee’s gender; literature suggests that the role and the perception of work-life balance and career opportunities are perceived differently according to gender. Likewise, it would be interesting to use other methodologies, with the same variables, to compare results and strengthen theoretical knowledge of this topic.
